

	Question	A	B	C	D	
0	Electricity may be used to make things move, and to generate one of the following:-	Heat	Sound	Light	Heat and light	D
1	An electric current flowing continuously in one Direction at a steady rate is called one of the following:-	Direct current	Pulsating current	Alternating current	Conventional current	A
2	The total resistance of several resistors connected in ----- is the sum of the individual resistors.	Series	Parallel	Series and parallel	Bridge style	A
3	An electric current which flows in one direction but which under goes regular recurring variations in magnitude is called one of the following:-	direct current	Pulsating current	Alternating current	Conventional current	B
4	Circuits which not come within the category of simple series or parallel ccts can be solved by means of Kirchhoff's law.	TRUE	FALSE			T
5	In first Kirchhoff's law the algebraic sum of currents meeting at any point in a ccts is	Maximum	Minimum	Zero	Equal to input	C
6	One of the following is any push or pull which alter or tends to alter the state of body, whether in rest or of uniform motion in a straight line:-	Power	Force	Energy	Energy and force	B
7	An electric current which alternately reverses its direction in a regular manner is called one of the following:-	Conventional current	Direct current	Pulsating current	Alternating current	D
8	The number of cycle occurring in one second is termed frequency and is given as one of the following:-	Cycle per second	Hertz per second	Cycle per minute	Hertz per minutes	A
9	In any given conductor, providing constant temperature, the ratio of p.d across the conductor to the current in the conductor is constant is called -----:-	Ohms law	Faradays law	Kirchhoff's law	Current law	A
10	Any material which gives a linear graph is said to obey one of the following:-	Ohms law	Current law	Voltage law	Kirchhoff law	A
11	The unit of resistance is -----:-	Ampere	Ohm	Mho	Impedance	B
12	Ohms law is a linear law :-	TRUE	FALSE			T
13	By lifting a pencil, energy is transferred from the person to the pencil	TRUE	FALSE			T
14	The electric charge can be one of the following:-	Electron and proton	Neutron and electron	Ions	Electron, ion or both	D
15	An electric current flowing continuously in one direction at a steady rate is called C current	TRUE	FALSE			T
16	A hard carbon film is posited onto a fiber rod and required resistance obtained by cutting a spiral track in cracked carbon film resistor :-	TRUE	FALSE			F

17	In carbon composition resistors the power that can be developed in this resistor is relatively small, then the other type of resistors :-	TRUE	FALSE			T
18	Anybody which has the ability to work possesses -----:-	Power	Force	Energy	Power and force	C
19	The accuracy of a resistors resistance value is indicated by its tolerance :-	TRUE	FALSE			T
20	The wire wound resistors has is advantage that the wire wound in the form of a coil, that may be suitable for many applications of radio :-	TRUE	FALSE			F
21	A potentiometer is arrange in such manner that a certain portion of the applied voltage can be tapped off	TRUE	FALSE			T
22	Carbon composition fixed type resistor are used where stability is important :-	TRUE	FALSE			F
23	A cracked carbon film type fixed resistor are used where greater stability is required :-	TRUE	FALSE			T
24	The physical lamination of a resistor predetermined by the power to be rated not by the resistance of the unit :-	TRUE	FALSE			T
25	Tellurium is a -----:-	Semi conductor	Good conductor	Good insulator	Poor conductor	A
26	The wattage rating of a resistor is the amount of electrical current that can be aspirated with out over heating:_	TRUE	FALSE			F
27	In carbon resistor the resistance varies with the heat humidity wear etc :-	TRUE	FALSE			T
28	The ceramic type capacitors comprises of, ceramic rod, metal end cap and one of the following :-	Outer ceramic and aluminum electrodes	Outer aluminum and ceramic electrodes	Ceramic rod and silver electrodes	Silver electrodes	C
29	The efficiency of a capacitor is always less than 100% because of the electric losses, brush is charge and one of the following :-	Eddy current losses	Skin current losses	Skin effect in the connecting leads	Reverse current losses	C
30	One of the following is the unit of power:-	Newton	Power	Watt	decibel	C
31	In the electric the losses are in the form of leakage current, heat losses and one of the following :-	Eddy current losses	Skin effect loss	Power losses	Hysteresis losses	D
32	Polystyrene type capacitors has value range from one of the following :-	10pf to 10 Mf	10 pf to 4 pf up to 500 VDC	100 mf to 1000 mf	100 no to 100 pf	B

33	dielectric hysteresis and one of the following the same type of losses in electric :-	dielectric flux losses	dielectric eddy losses	Eddy current losses	dielectric absorption	D
34	When P.D is applied across dielectric a current flows is called :-	FWD current	Leakage current	Leakage power	Total current	B
35	In power capacitor, one end of the capacitors is marked with a black band to indicate one of the following :-	+ve end	Ground end	Outer electrode	Output end	C
36	Germanium and silicon are -----:-	Good conductor	Poor conductor	Poor insulator	Semi conductor	D
37	Nonelectric is a perfect insulator ,so when P.D is applied the one of the following current flows :-	Skin current	Eddy current	Leakage current	Reverse current	C
38	The dielectric strength depends upon material tempetature,thickness and one of the following :-	Power	Energy	Current	Frequency	D
39	during the time that the electrons orbit is changing, there is a general movement of electrons in the electric which is called :-	Skin current	FWD current	Reverse current	displacement current	D
40	The electric strength is the P.D required, one of the following :-	To heat up the electric	To breakdown the electric	To pass the required current	To warm-up the electric	B
41	The wattage rating of a resistor is determined by the amount of one of the following :-	Current flows through it	Total area	Applied voltage and current	Surface area	D
42	Joule is the unit of one of the following:-	Work	Force	Power and force	Energy and work	D
43	A potentiometer has one of the following number of connection :-	4	1	2	3	D
44	A rheostats is a variable resistor which has one of the following number of connections :-	1	2	3	4	B
45	A rheostats is a variable resistor and is inserted in one of the following forms :-	In parallel	In series	In series or parallel	In bridge form	B
46	In one of the following type of resistors the resistance value is adjusted by etching a spiral track through the film :-	Matel film resistors	Cracked carbon film resistors	Carbon film resistors	Carbon composition type resistors	A
47	A movement of free electron through a conductor always causes one of the following:-	Cold	Hot	Cold or hot	Movement cannot effect	B
48	The wire nickel chrome or copper nickel have a :-	Low resistivity	Very low resistivity	High resistivity	Medium resistivity	C
49	A thin film of platinum-gold compound is coated on to a glass plate or tube in one of the following type of resistors :-	Wire wound	Metal film	Cracked carbon	Carbon composition	B

50	The wire wound resistors has temperature coefficient of resistance is :-	Low	High	Very low	Medium	A
51	The resistor value like 10, 15, 22, 33, 47, 68, 10, ohm's with $\pm 20\%$ are known as:-	Low value	Common values	Fixed values	Preferred values	D
52	What will be the color coding of a 6800 $\pm 1\%$ resistor :-	Blue, red, gray, gold	Blue, gray, red, silver	Blue, gray, red, brown	Blue, gray, red, gold	D
53	In resistor colour coding the 4th band shows the :-	1st figure	4th figure	Multiplying factor	Tolerance	D
54	The electron so stripped off may attach itself to a neighboring atom which then become a -----:-	Positive ion	Negative ion	Proton ion	Positive or negative ion	B
55	If the golden colour is in the 4th band then the tolerance of the resistor will be :-	5%	10%	15%	20%	A
56	The colour coding is used to indicate the resistance value of the :-	Composition type resistors only	Carbon composition type resistors only	Carbon composition and cracked carbon type resistors	Wire wound resistors	C
57	What will be the value of a resistor if it has body=brown, tip=blue, spot=orange :-	16000 $\pm 1\%$	61000 $\pm 1\%$	1600 $\pm 1\%$	6100 $\pm 1\%$	A
58	The practical unit of charge or quantity of electricity is one of the following:-	Power	Ampere	Watt	Coulomb	D
59	If there is no 4th band on resistor then the tolerance will be :-	4%	20%	10%	5%	B
60	If the silver colour is in the third band then the multiplying factor will be :-	0.1	0.01	0.001	1	B
61	In one of the following type of resistors a hard film is posited on to a ceramic rod :-	carbon type	Wire wound resistor	Cracked carbon film resistor	Metal film	C
62	Resistors are used for a specific purpose such as :-	To provide power	To provide gain	To provide heat	To provide P.D	D
63	One of the following resistors has very low stability :-	wire wound	Carbon composition	Matel film	Cracked carbon	B
64	One of the following effect is used in battery charging :-	Heating effect	Chemical effect	Magnetic effect	Ionization effect	B
65	One of the following is the unit of force:-	Newton/meter	Newton/sec	Newton	Joule/meter	C
66	Velocity or speed is measured in one of the following unit:-	Meter/sec	Meter/sec square	Feet/sec	Feet/joule	A

67	When a pencil is allowed to fall, the potential energy is converted into -----:-	Kinetic energy only	Energy of motion only	Mechanical energy only	Kinetic energy or energy of motion	D
68	Energy can be converted from one form to another form	TRUE	FALSE			T
69	The practical unit of charge or quantity of electricity is -----:-	Charge	Coulomb	Farad	Ampere	B
70	A----- is a substance in which there is practically no random movement of free electrons	Insulator	Conductor	Semi conductor	Pure insulator	A
71	The unit of current is one of the following:-	Power	Coulomb	Ampere	Newton	C
72	If in any circuit, the quantity of electricity passing at a given point in one second is one coulomb, the current will be one of the following:-	One ampere	One coulomb	One ampere per sec	One newton	A
73	The resistivity of a material varies with temperature	TRUE	FALSE			T
74	Polystyrene type capacitor is very similar in construction to the stacked mica capacitor with polystyrene strip in place of mica :-	TRUE	FALSE			t
75	The variable capacitor used in radio circuit are normally one of the following electric :-	Mica as electric	Liquid as electric	Paper as dielectric	Air as electric	D
76	In the variable capacitor the rotors are normally connected in parallel via the chassis by a , one of the following :-	Metal strip	Rubber strip	Spring contact	Metal or rubber strip	C
77	In any given electric the breakdown voltage will depend on the material of electric and thickness only	TRUE	FALSE			F
78	In the variable capacitor, when the rotors are fully out of mesh with the stator the effective area will be one of the following :-	Max	Min	Infinity	Nil	D
79	In the variable capacitor, when rotors are fully in mesh the effective area will be one of the following :-	Max	Min	No change	Infinity	A
80	In the variable capacitor a typical variation of capacitance is in one of the following ranges :-	50 no to 500 pf	50 pf to 500 pf	500 no to 5000 no	50 no to 50 uf	B
81	The capacitor can be used only in those circuit where	Polarizing voltage	Non polarizing C voltage	As required	Frequency is not required	A
82	A paper capacitor contained three different things in its construction one is paper strip, two is waxed container and third is one of the following :	Metal foil	Ceramic rod	Plastic strip	Aluminum foil	D
83	Capacitor value range from 0.5pf to 0.005 uf at working voltages of up to 5000V, is a form of one of the following capacitors :-	Paper capacitor	Ceramic capacitor	Paper and ceramic capacitor	Electrolyte capacitor	B

84	The trimmer capacitor 2 pf to 150 pf at working voltage up to 350VC:-	TRUE	FALSE			T
85	In the variable capacitor although the effective area can be reduced to zero but the capacitance cannot :-	TRUE	FALSE			T
86	In the connecting or mounting a capacitor the peak voltage applied must be at one of the following state :-	Less than the rating voltage	Equal to the capacitor working voltage	More than the capacitor rating	Not more or less than the capacitor rating	A
87	In the variable capacitor both the parallel plates are moveable:-	TRUE	FALSE			F
88	The wet electrolyte type has been almost entirely replaced by theory electrolyte type in a polystyrene type capacitor:-	TRUE	FALSE			F
89	The paper capacitor is constructed in the form of a coil so its self inductance gives rise to certain difficulties at high frequencies:-	TRUE	FALSE			T
90	In the electric losses the applied voltage V lags behind the charge Q	TRUE	FALSE			F
91	In high voltage capacitor the corners of their plates rounded off to avoided one of the following :-	Brush discharge	Skin effect	dielectric losses	Magnetic effect	A
92	How many factors are important for choice the electric in capacitor :-	1	2	3	4	C
93	dielectric hysteresis gives rise to a loss of energy in a manner similar to that for one of the following :-	Electric hysteresis	Magnetic hysteresis	Skin hysteresis	Copper hysteresis	B
94	The efficiency of the capacitor can not be 100%ue to one of the following :-	dielectric losses, skin effect	Skin effect, brush discharge	Brush discharge, dielectric losses	electric losses, skin effect, brush discharge	D
95	The efficiency of the capacitor is always less than 100% because of one of the following :-	Brush discharge	Magnetic hysteresis	Impurities	Copper losses	A
96	One of the following is a value range of paper type capacitor at working voltage up to 150KVC:-	0.002 uf to 12 uf	0.0002 uf to 12 uf	0.0002 mf to 12 uf	0.002 mf to 12 uf	B
97	While mounting swell capacitor by there lead the length of the ;lead should not exceed by one of the following :-	1mm	1.5 inches	1 inch	0.5 inch	D
98	The losses associated with the electric is the important factor for choosing the electric of capacitor :-	TRUE	FALSE			T
99	Nonelectric is a perfect semiconductor :-	TRUE	FALSE			F

100	One of the following capacitors have negative and positive polarity:-	Mica capacitor	Ceramic capacitor	Paper capacitor	Electrolyte capacitor	D
101	Which one of the following thing must be given consideration for the construction of capacitor :-	Material of the plate of negative terminal	dielectric	Space between two plates	Size of capacitor	B
102	during the time that the electron orbit is changing ,there is a general movement of electron in the electric this constitutes one of the following :-	A pulsating current	Direct current	Displacement current	An alternating current	C
103	Nonelectric is a perfect insulator :-	TRUE	FALSE			T
104	If we increase the temperature of the electric then the reduction in the breakdown voltage will be occur:-	TRUE	FALSE			T
105	Which one of the following capacitor is placed in parallel with the main variable capacitor :-	Trimmer capacitor	Split stator capacitor	Electrolyte capacitor	Ceramic capacitor	A
106	While mounting small capacitor by their leads, length of leads should not exceed one of the following :-	1/3 inch	1/2 inch	1/4 inch	1/5 inch	B
107	When we place capacitor in series ,the total capacitance will be :-	Sum of all capacitor	Half of total capacitance	Less than the smallest individual	More than the bigger individual	C
108	The total capacitance is less than the smallest individual capacitance ,this advantage of the capacitor is achieved from one of the following type of capacitor :-	Trimmer capacitor	Split state capacitor	Variable capacitor	Polystyrene type	B
109	Breakdown voltage of electric will depend on :-	Material, temperature	Thickness, frequency	Frequency, temperature	Material, thickness, temperature	D
110	The trimmer capacitor is normally placed in one of the following formulation :-	Series and parallel	Series with the main capacitor	Parallel with the main capacitor	Parallel and then series	C
111	One of the following type of capacitor with the air electric are used in some radio equipment :-	Split stator capacitor	Fixed stator capacitor	paddlers	trimmers	A
112	In the split stator capacitor the advantage thus attained is that no :-	Fraction noise is induced	Split noise in the circuit	Congenital noise in the circuit	Contact noise is introduced	D
113	In the variable capacitor ,all the stator vanes are being connected in one of the following pattern :-	Parallel and then series	Series and then parallel	Parallel only	Series only	C

114	In many circuits radio equipment it is necessary to vary the frequency ,one of the following type of capacitor is used :-	Ceramic capacitor	Wire wound capacitor	Electric capacitor	Variable capacitor	D
115	AVTR system record all information which are appear only on HUD :	TRUE	FALSE			F
116	In FM system one of the following is correct :-	Carrier is varied	Carrier is constant	Frequency constant	Channel difference	B
117	FM system is confined to one of the following frequencies :-	VLF and above	UHF and above	HF and above	VHF and above	D
118	GPS stands for :-	Ground positioning system	Global positioning system	Global pointing system	Ground pointing system	B
119	In FM the signal to noise ratio is less than AM :-	TRUE	FALSE			F
120	Theta from GPS cannot be own loaded to PC for analysis purpose :-	TRUE	FALSE			F
121	VHF range is :-	3 MHz to 30 MHz	30 MHz to 300 MHz	30 GHz to 300 GHz	30 MHz to 3000 MHz	B
122	UHF stands for :-	User sight frequency	Universal sight frequency	Ultra high frequency	Unfold high frequency	C
123	The GPS calculates velocity after takeoff and true air speed during flight :-	TRUE	FALSE			F
124	The HUD device provides one of the following during approach and navigation :-	Air speed & heading	Air speed, heading and altitude	Heading & altitude	Speed & heading	B
125	In the FM transmission the range is one of the following :-	High and in the line of sight	Low and in the line of sight	Limited to the line of sight	Medium to the line of sight	C
126	One of the following system provides the fuel requirement for a trip :-	CRT	HUD	GPS	AVTR	C
127	The AVTR stands for :-	Air born visual tape recorder	Air born video recorder	Air born video tape recorder	Air video tape receiver	C
128	AVTR is a system which record one of the following information :-	All HUD information with Audio	All information of all system	All video tracks	Audio tracking functions	A
129	When all input are one (1), the output off AND gate will be :-	One with carry one	One	Zero with carry one	Zero	B
130	The gate output is a logic one state only if all inputs are in logic one state :-	NOT gate	NAND gate	OR gate	AND gate	D

13 1	The basic gate which has two or more inputs and single output is the OR gate :-	TRUE	FALSE			T
13 2	One of the following state is not correct about NOR gate :-	000=1	010=0	000=0	111=0	C
13 3	The gate which has output voltage is a logic zero state only when all the inputs are at logic one state :-	NOR gate	NAND gate	EX-OR gate	AND gate	B
13 4	One of the following is correct about NOT gate :-	Same output as input	output one if input one	output opposite to input	Input equal to output	C
13 5	To make logicscission three basic circuits are used called :-	Registers	Flip flop	Triggers	Gates	D
13 6	Reverse biased are also called backward biased :-	TRUE	FALSE			T
13 7	HUD is an electro-optical device provides the pilot only target range :-	TRUE	FALSE			F
13 8	In reverse biased the -ve terminal attracts holes away from the junction an depletes the holes in P type materials:-	TRUE	FALSE			T
13 9	In reverse biased the -ve terminal attracts holes away from the junction an depletes the holes in P type materials:-	TRUE	FALSE			T
14 0	In reverse biased the -ve terminal attracts holes away from the junction an depletes the holes in P type materials:-	TRUE	FALSE			T
14 1	Germanium crystal in its purest state act as a conductor but when small amount of impurity like arsenic is added than it becomes insulator	TRUE	FALSE			F
14 2	Semiconductor diodes operates in the reverse voltage breakdown region are used as :-	Current regulators	Potentiometers	Voltage regulators	Rectifiers	C
14 3	Semiconductor diodes operates in the reverse voltage breakdown region are used as :-	Current regulators	Potentiometers	Voltage regulators	Rectifiers	C
14 4	Semiconductor diodes operates in the reverse voltage breakdown region are used as :-	Current regulators	Potentiometers	Voltage regulators	Rectifiers	C
14 5	The important difference between conductors and insulators is that in the conductors there are:-	2 or 4 electrons in the outer shell and not tightly bounded to nucleus	1or 2 electrons and not tightly bounded to nucleus	The outer shell is almost filled	No valance electron is available	B
14 6	In a sample of germanium or silicon with broken bonds is subjected to voltage :-	Three kind of current will flow	One kind of current will flow	Two kind of current will flow	One kind of current will flow with variations	C

147	The electrons in the outer most shell the atom of semiconductor can be determined when some form of energy is supplied to material the energy may be in the form of :-	Light and magnetic field	Heat light or an electric field	Heat only	Polarization	B
148	The CRT is primary indicating device with :-	Very heavy pointer	Very light pointer	Very slow pointer	Very fast pointer	B
149	Substance that produce the free motion of a large number of electrons are called :-	Semiconductors	Insulators	Conductors	Poor insulators	C
150	When a small amount of impurities, such as arsenic is added to crystal it becomes a satisfactory _____:-	Insulator	Conductor	Semiconductors	Poor insulators	B
151	The chemical and electrical characteristics of the substance is determined by :-	Inner most shell	Outer most shell	In both shell	at nucleus bond	B
152	A Germanium crystal in its pure state is act as :-	Insulator	Conductor	Semiconductor	Poor insulator	A
153	In transistors if the battery voltage are increased to the point where the barrier potential across the junction is completely neutralized than :-	Heavy current will flow	Low current will flow	Junction will ok	Oscillation occurs	A
154	Transistors make use of flow of electrons through special type of solid known as :-	Insulator	Conductor	Semiconductor	Poor insulator	C
155	The orbit of the planetary electrons are grouped in shells with specified number of electrons in each shell ,shell no 2 contains :-	4 electrons	6 electrons	8 electrons	18 electrons	C
156	The position of an atom in the crystal is reformed to as a lattice site (location)	TRUE	FALSE			T
157	In CRT the pointer is a beam electrons which may be reflected by means of :-	Electric field	High velocities	Magnetic field	Electric or magnetic field	D
159	One of the following is the UHF range :-	30MHz to 300MHz	30 MHz to 399.975 MHz	30 MHz to 399.995 MHz	300MHz to 3000 MHz	D
	In CRT the pointer is a beam of :-	Electrons	Protons	Neutron	Electric lines	A
	In the frequency modulation the amplitude of the carrier frequency is kept one of the following :-	High	Low	Medium	Constant	D
	UHF is normally used for one of the following :-	Short distance communication	Long distance communication	Medium distance communication	Limited range in line of sight	B
